Clean water goes hand in hand with good health

Access to safe drinking water is vital for human health. Poor water quality has a direct impact on health, and lack of clean and safe drinking water is almost always responsible for sickness and disease.

LIQUINEX

According to the medical professionals, several top causes of disease outbreaks are related to unsafe water. Bad as that sounds, it's far from a complete list. There are also health risks related to consuming water contaminated with organic and inorganic matter, bacteria and viruses and other pollutants.

You don't have to be a rocket scientist to realise that poor water quality is bad for you, but safe, clean water is key to life, and good for you.

Stay hydrated, stay healthy with clean drinking water

Water more than quenches our thirst. Up to 60% of the human body is water. Clean, safe water is essential to keep your body functioning properly and feeling healthy. Nearly all of the human body's major systems depend on water to survive and function. You'd be surprised about what staying hydrated with clean, safe water can do for you.

Clean water boosts your immune system

Water is actually more important for our body than food. While a person can survive without food for up to a month, one can only live without water for just about a week.

Conversely, regularly drinking clean safe water has a long list of positive health benefits. Water helps remove toxins from the body, it helps with digestion, it's great for nutrient absorption, it aids circulation, it reduces fatigue and helps the body's cooling system.

In fact, drinking clean water can help you lead a healthier, longer life. See, the human body can't store a large supply of water. It needs a regular supply of clean water to hydrate cells and remove toxins. Without this vital replenishing of clean water, your body dehydrates, and the blood literally thickens. This has a negative health effect. Seeing how necessary water is, it is important we all get our daily quota of clean, safe drinking water¹.

World-class safe, clean water from every tap in your home

The WaterWall is an extension of Liquinex's award-winning suitcase-sized humanitarian water purification system inspired by Tesla's PowerWall. The WaterWall is a compact residential water purification system for regions where piped water quality does not meet drinking water standards. It is conveniently installed in a house or community facility at the point of entry and

is capable of purifying and distributing 300 gallons/ day (1135 litres/ day) of piped water into drinkable, safe tap water. The WaterWall uses state-of-the-art hybrid technology membrane chip-scale UVC disinfection technology in partnership with Lightlab, Sweden.

WaterWall – the benefits are many

The convenience of drinking, cooking, making coffee or baby formula right in the comfort of your own home or workplace. The confidence that you are getting clean water from a proven and trusted source. And the reassurance that you're not relying on bottled water (not good for the planet) or a water delivery service (not good for your wallet). These are just some of the top line benefits of WaterWall.

Here are a few more:

- Improves health by providing easy access to clean, safe water
- Provides convenient access to clean, safe water
- Secures clean, safe drinking water for children, adults, and the elderly
- Provides high quality water that can be safely used by healthcare professionals for sanitation and drinking
- Ensures water quality and safety in F&B and hospitality scenarios

Additional recommended reading

In the article "A balancing act between immunity and longevity", referring to the original research by Adam Antebi from the Max Planck Institute for Biology of Aging in Cologne, Germany, an evidence was found suggesting that increased inflammation causes the aging process to speed up, and that there is a fine balance between maintaining immune system function and longevity².

The population in developing countries have a more active immune system than the population in developed countries. This paper studies the immune system of children in two different environments: high vs low microbial exposure environments³.

Other evidence of a more active immune system in the population of developing countries. In the paper titled "Imunitas Pada Traveller's Disease" was mentioned: "The number of incidents (of Traveller's Diarrhoea)" is higher for travellers originating from highly industrialized (developed) countries." (pg.22)⁴

The above suggests that the incident number of traveller's diarrhoea for travellers from developing countries are less. Also, according to the paper, the highest incidents of traveller's diarrhoea occur in Africa, South Asia, Central Asia, and West Asia. In Southeast Asia, both Indonesia and Vietnam rank 1st for the most incidents (19%) of traveller's diarrhoea in the region. Singapore ranks last with only 2.3% of incidents⁵.
